

Application Serial No. 09/513,554
Amendment Dated October 28, 2005
Office Action of June 28, 2005

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application.

1. (Previously Presented) A system for retrieving web-based content from a plurality of sites on the Internet, the system comprising:

a terminal coupleable to the Internet; and

an engine module accessible on the Internet to receive user-defined configuration information from the terminal,

wherein the engine module selects to automatically fetch web-based content from a plurality of sites on the Internet operating under a first language using the user-defined configuration information in accordance with selected criteria by a user for each particular site, and converts all of the selected web-based content from each Internet site in the first language into a second language before signaling the web-based content from each Internet site to an end device operating under the second language in accordance with the specified user-defined configuration information.

2. (Previously Presented) The system of claim 1, wherein the engine module converts the web-based content from an HTML language to a wireless language.

3. (Canceled)

4. (Previously Presented) The system of claim 1, wherein the engine module converts the web-based content into the second language based on configuration information that specifies a type of end device.

5. (Original) The system of claim 1, wherein the terminal includes a user-interface that allows an end user to specify configuration information.

Amendment Dated October 28, 2005
Office Action of June 28, 2005

6. (Previously Presented) The system of claim 1, wherein the engine module converts the web-based content into the second language based on configuration information that specifies a type of end device selected from a group consisting of a cell phone, a PCS type device, a pager, and a wireless handheld computer.

7. (Previously Presented) The system of claim 1, wherein the engine module converts the web-based content from the first language into the second language and a third language before signaling the web-based content to the end device operating under the second language and a second end device operating under a third language.

8. (Previously Presented) The system of claim 7, wherein the engine module converts the web-based content into the second language and the third language based on configuration information that specifies two or more end devices selected from a group consisting of a cell phone, a PCS type device, a pager, and a wireless handheld computer.

9. (Previously Presented) A system for retrieving web-based content from a plurality of sites on the Internet, the system comprising:

a terminal coupleable to the Internet;

an engine accessible on the Internet to receive user-defined configuration information from the terminal, the engine selecting to automatically fetch web-based content from a group of preselected sites on the Internet using the user-defined configuration information in accordance with selected criteria by a user for each particular site, wherein the engine signals all of the web-based content fetched from each of the of preselected sites to an end device in accordance with the specified user-defined configuration information.

10. (Previously Presented) The system of claim 9, wherein a first site in the plurality of sites operates under a first language, a second site operates under a second language, and the engine accesses the first site and the second site to retrieve web-based content, converts the retrieved web-

based content to a wireless language for a wireless end device; and then signals the end device the retrieved web-based content.

11. (Original) The system of claim 10, wherein the engine retrieves a first email from the first site, and a second email from the second site, and signals a notification to the end device notifying an end user of the terminal of the first and second email.

12. (Previously Presented) A system for retrieving web-based content from the Internet, the system comprising:

- a terminal coupled to the Internet, the terminal being able to receive user-defined configuration information entered by an end user;
- an end device operable under a selected wireless language; and
- an engine module accessible to the Internet to receive the user-defined configuration information from the terminal, the engine module selecting to automatically fetch web-based content from multiple web sites using the user-defined configuration information in accordance with selected criteria by a user for each particular web site, wherein the engine module is capable of converting the web-based content into the selected wireless language as needed and then signals all of the web-based content fetched from the multiple web sites to the end device in accordance with the specified user-defined configuration information .

13. (Previously Presented) The system of claim 12, wherein the end device is a wireless phone, and end user specifies a phone number of the wireless phone to the terminal to allow the engine module to signal the web-based content to the wireless phone.
